List of Figures

List of Tables

List of Abbreviations

TCS: total cross section

SDCS: single-differential cross section

DDCS: double-differential cross section

TDCS: triple-differential cross section

TICS: total ionisation cross section

CCC: convergent close-coupling

$\mathrm{CCC}(N)$: convergent close-coupling calculation performed with N one-electron basis states

$\mathrm{CCC}(C, N)$: convergent close-coupling calculation performed with C core states and N one-electron basis states

$\mathrm{CCC}(C, N, \lambda)$: convergent close-coupling calculation performed with C core states, and N one-electron basis states with exponential fall-off parameter λ

ECS: exterior complex scaling

PECS: propagating exterior complex scaling

1   Introduction

1.1   Electron-Impact Helium Scattering Processes

1.2   Experimental Review

1.3   Theoretical Review

2   Theory

2.1   Convergent Close-Coupling Method for an Atomic Target

2.1.1   Laguerre Basis

2.1.2   Target States

2.1.3   Total Wavefunction

2.1.4   Convergent Close-Coupling Equations

2.2   Scattering Statistics

2.2.1   Scattering Amplitudes

2.2.2   Ionisation Cross-Sections

2.3   Considerations for a Helium Target

2.3.1   Partially Frozen-Core Model

2.3.2   Auto-Ionising Target States

3   Results

3.1   Computational Hindrances

3.1.1   Attaining Multi-Parameter Convergence

3.1.2   Target State Fidelity

3.1.3   Handling Interference from Auto-Ionising Target States

3.2   Total Ionisation Cross-Sections

4   Conclusion
